

pHandORP – Mineralise tap water anytime & anywhere!

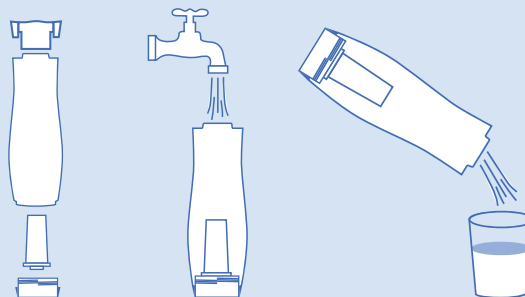

The pHandORP is a mobile water filter and container, that provides clean, mineralised, alkaline water by the same means nature does. You need nothing more than 600 ml of tap water per use. It can't be simpler to enjoy good water anywhere you want.

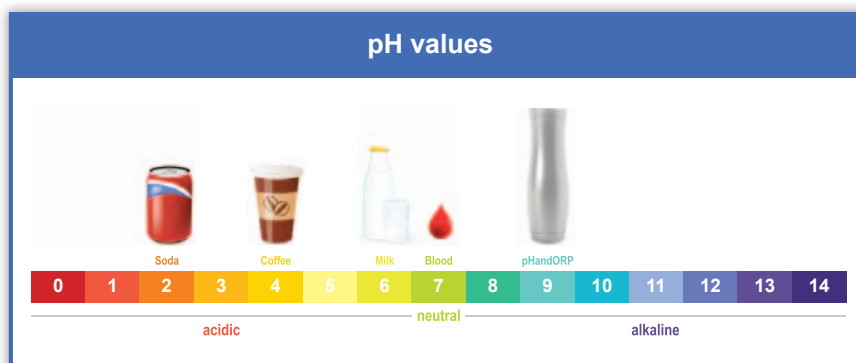

Negative ions for alkalization are naturally occurring, as in clean air and some minerals. Those are the ones used in the pHandORP filter. The filtered water has an average pH value between 8 and 9, depending on water quality.

Technical data:

Weight: 450 g
Measurements: height 267 mm
 diameter 100 mm
Material: Metal, BPA-free
 duroplastic
Capacity: 600 ml

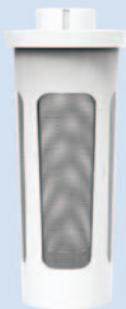

Your body automatically keeps your blood's pH level balanced. The more acidic food or drink we consume, the more our body has to work to keep this level. That's why it makes sense to help him by drinking water with a pH level of 8 or 9, like the pHandORP delivers. Plus you help the environment, because you waive the use of many plastic water bottles.

The exchangeable filter contains:

- Active carbon
- Biomineral granulate
- Magnets to fabricate „hexagonal water“
- Natural coral granulate

Based on the average water consumption of an adult, a filter's lifetime includes 90 days, depending on tap water quality. Chlorine, heavy metals, pesticides and bacteria as well as undesired odorous or flavoring substances are filtered from your water. And the ecological advantages of the pHandORP are pretty obvious:

1 filter instead of 200 litres of bottled water!
